

Independent Minds EDU

Project Record Document - Generated 2026-07-12

1. Project Purpose

Independent Minds EDU is a family-focused education platform designed to help parents and guardians manage homeschool workflows, monitor student progress, and support learning through planning tools, reporting, and AI-assisted tutoring.

2. Technical Foundation

- Frontend: React + TypeScript + Vite + Tailwind + shadcn/ui
- Backend: Supabase (Auth, Postgres, Edge Functions, Storage)
- Hosting: Vercel
- Domain: <https://www.independentmindsedu.org>
- Notifications: Email, Telegram, WhatsApp/Twilio

3. Recent Stabilization Outcomes

- Legacy Lovable-facing dependencies and references were migrated out of core flows.
- Google OAuth callback handling was hardened for both query-code and hash-token return patterns.
- Canonical host handling for login flow was improved to reduce apex/www mismatch issues.
- User-facing sender branding was standardized to Independent Minds EDU identity.
- Global lint gate was unblocked for ongoing delivery continuity.

4. Operational Status Snapshot

Area	Status	Notes
Production Domain	Active	Primary domain is publicly reachable.
Auth (Google)	Configured in progress	Requires exact Google/Supabase console alignment.

Email Branding	Standardized	Sender identity aligned for user-facing mail.
Code Delivery	Ongoing	Main branch used as release path.

5. Pre-Paid Launch Requirements

- Implement billing stack (Stripe suggested): plans, checkout, webhooks, entitlement gating.
- Define subscription lifecycle states: trialing, active, past_due, canceled.
- Create customer billing/self-service pages and admin revenue dashboard.
- Finalize legal pages and commercial policy (privacy, terms, refund language).
- Set up production monitoring for auth errors, payment failures, and edge function health.

6. Risk Notes

- OAuth UX branding in Google picker depends on Google OAuth Consent Screen + auth domain setup.
- Dashboard-side provider settings must match exact callback URLs and OAuth client values.
- Cloudflare/WAF policy can intermittently affect automated endpoint checks.

7. Recommended Next Execution Window (30 Days)

- Week 1: Lock OAuth reliability, add auth observability, finalize provider settings.
- Week 2: Build billing core and webhook processing.
- Week 3: Add account/billing UX and entitlement enforcement.
- Week 4: Conduct launch QA, support readiness, and paid onboarding rollout.
